DNA as the genetic material

Part 2 Types of Cells

1 Key differences between prokaryotic and eukaryotic cells

Prokaryotic cells lack a nucleus and other membranebound organelles

Eukaryotic cells have a nucleus and other membranebound organelles

Prokaryotic cells are typically smaller than eukaryotic cells

Prokaryotic cells have a simpler structure and organization

2 Examples

Prokaryotes: Bacteria and Archaea

Eukaryotes: Plants, animals, fungi, and protists

3 Eukaryotic cells are considered more complex because they have a more sophisticated internal organization with specialized compartments (organelles) that perform specific functions

Part 3 Organelles

4 Table 1: Organelle Structure and Function

Organelle	Structure	Function
Nucleus	A large spherical organelle enclosed by a double membrane nuclear envelope containing DNA and RNA	Stores genetic information, DNA, and controls cellular activities through the synthesis of proteins
Mitochondria	Elongated, bean-shaped organelles with an outer membrane and an inner membrane folded into cristae	Powerhouse of the cell; produces ATP (adenosine triphosphate) through cellular respiration
Endoplasmic Reticulum	A network of interconnected membranes that extend throughout the cytoplasm	Smooth ER synthesizes lipids and steroids; while rough ER modifies and transports proteins
Golgi Apparatus	A stack of flattened, membranebound sacs (cisternae)	Involved in protein modification, sorting, and packaging; packages and modifies proteins for secretion or delivery to other organelles
Lysosome	Small spherical organelles containing digestive enzymes	Breaks down cellular waste, debris, and engulfed pathogens
Ribosome	Small granular structures composed of RNA and protein	Synthesize proteins based on the instructions encoded in mRNA
Cell Membrane	A thin, flexible barrier that surrounds the cell, composed of phospholipids and proteins	Regulates the passage of substances into and out of the cell
Cell Wall (Plant Cells)	A rigid outer layer surrounding the cell membrane, composed primarily of cellulose	Provides structural support and protection to the cell

Part 4 Cellular Processes

1 Protein synthesis is the process of creating proteins based on the instructions encoded in DNA. This involves DNA transcription. The genetic code in DNA is transcribed into a molecule of messenger RNA (mRNA). mRNA translation: Ribosomes read the code in mRNA and assemble amino acids into a polypeptide chain which folds into a protein.

2 Mitochondria generate energy in the form of ATP through cellular respiration which involves Glycolysis. The breakdown of glucose into pyruvate in the cytoplasm. Krebs Cycle: The oxidation of pyruvate in the mitochondrial matrix producing electron carriers NADH and FADH₂.

5 Electron Transport Chain: The transfer of electrons through a series of protein complexes in the inner mitochondrial membrane resulting in ATP production.

3 The endoplasmic reticulum (ER) plays a crucial role in protein modification and lipid synthesis.

Rough ER: Ribosomes attached to the rough ER synthesize proteins which are then modified and transported through the ER.

Smooth ER: Synthesizes lipids, steroids, and phospholipids and detoxifies harmful substances.

4 The Golgi apparatus processes and packages proteins for secretion or delivery to other organelles.

Modification: Proteins are further modified and processed within the Golgi cisternae.

Sorting: Proteins are sorted based on their destination.

Packaging: Proteins are packaged into transport vesicles for delivery to their final destinations.

Part 5 Comparison of Plant and Animal Cells

1 Key differences between plant cells and animal cells

Cell Wall: Plant cells have a cell wall while animal cells do not.

Chloroplasts: Plant cells contain chloroplasts which are responsible for photosynthesis while animal cells do not.

Vacuoles: Plant cells have a large central vacuole while animal cells may have smaller vacuoles.

2 Specific organelles present in plant cells but not animal cells

Chloroplasts, Cell Wall, Central Vacuole.

3 The differences in organelles reflect the different functions of plant and animal cells

Cell Wall: Provides structural support and protection in plant cells which are typically immobile.

Chloroplasts: Enable plants to carry out photosynthesis producing their own food.

Central Vacuole: Stores water, nutrients, and waste products in plant cells contributing to turgor pressure.

Conclusion: This worksheet provides a comprehensive framework for understanding the fundamental building blocks of life: cells and their organelles. By exploring the structure and function of these components, students gain a deeper understanding of the intricate mechanisms underlying all living organisms. Further exploration of the current trends and ethical considerations associated with cell biology highlights the dynamic nature of this field and the importance of responsible scientific inquiry.
